Guilherme Camarada

Portugal | guilhermecamarada.dev@gmail.com | guilherme-camarada.github.io | github.com/Guilherme-Camarada

Skills

Development: REST API, C#, Java, ASP.NET Core, Spring Boot, Kotlin, TypeScript, Angular, React, JavaScript, Unity
Data: MySQL, MSSQL, MongoDB
Cloud & Tools: Azure, Render, Docker, Git, Jira, Confluence, Notion

Experience

Unity Developer, Overflow Interactive – Setúbal, Portugal July 2025 – October 2025

- Architected modular gameplay systems using C# by adhering to SOLID principles and Clean Code standards to decouple dependencies and ensure long-term technical maintainability.
- Collaborated within a ScrumBan agile environment using sprint cycles and centralized Confluence documentation to guarantee continuous delivery and high project quality.
- Engineered a 3D physics-based dice throw system utilizing Unity Rigidbody and event-driven architecture to effectively decouple game logic from animation.
- Implemented a custom A* pathfinding algorithm with C# on hexagonal grids to facilitate dynamic obstacle avoidance and AI movement.
- Developed a procedural map generation module leveraging Perlin noise and axial coordinates to dynamically generate distinct biomes and automatically place structures.
- Designed a scalable reward system using Scriptable Objects and the Strategy pattern, empowering game designers to iterate content independently of source code.

Projects

Post Credits - Movie & TV Series watchlist app Showcase | GitHub

- Architected a RESTful Web API in ASP.NET Core (C#) integrated with Entity Framework Core, engineering secure authentication, token-based email verification, and transactional password-reset flows via ASP.NET Identity.
- Integrated The Movie Database (TMDb) API via asynchronous HTTP services, designing custom domain logic for user watchlists, multi-category media filtering, and friend rating comparisons.
- Built and deployed the application with React and TypeScript on Render, configuring environment variables, routing, and production build pipelines.

Plants R' Pets - A garden growing helper and learning app. Showcase | GitHub

- Co-developed the Plantations monitoring module within an ASP.NET Core Web API (C#), engineering backend logic to track plant care metrics including watering schedules, pruning cycles, and sunlight exposure.
- Developed the Plant Wiki by pairing an Angular frontend with backend REST services, integrating third-party botanical and geolocation APIs to deliver plant care recommendations.
- Configured and deployed the application to Microsoft Azure, setting up environment variables, routing, and endpoint verification with Swagger.

Education

Instituto Politécnico de Setúbal (Final Grade: 15/20) – BS in Software Engineering June 2026

- Relevant Coursework: Software Architecture, Algorithms & Data Structures, Distributed Systems, Relational Databases, Object-Oriented Programming (C# / Java), Agile Project Management.
- Developed projects as a team utilizing Angular, TypeScript, ASP.NET Core frameworks and other domains, engineering a cohesive software architecture for each project.
- Applied core software architecture concepts, design patterns, refactoring and Clean Code principles to design maintainable and scalable projects.
- Managed project workflows using Jira and Confluence within Agile methodologies to track team sprints and maintain technical documentation.
